

VARIABLES

VARIABLES: ek tarah se memory me container ki tarah hota ha jo kisi value ko hold krte ha.

Variables hamesha [**DATATYPE + IDENTIFIERS** = [Value] **LITERAL + (;)**] ko mila k bnte ha.

IDENTIFIERS

IDENTIFIER: ka container me kisi bhi value ko represent krne ka kaam hota ha.

DATATYPE

DATATYPE: Iska kaam ha ye batana ki ek **VARIABLE** me kis type ka **IDENTIFIER** ha.

2 TYPES OF DATATYPE

<u>[1] PRIMITIVE DATATYPES</u>	<u>[2] NON-PRIMITIVE DATATYPES</u>
A] Integer : byte, short, int, long. B] Real no : float, double C] Character: char D] Boolean: boolean	

A] Integer : byte, short, int, long.

<u>INTEGER</u>	<u>WIDTH IN BITS</u>	<u>RANGE</u>
Byte	8 [_ _ _ _ _] $[2^8-1] = 255$ Iska mtlab 8 bit total 255 no carry kr skti ha.	-128 to 127 [total=255 no _s ha]
Short	16 $[2^n-1] = \text{total numbers}$	-32,768 to 32767
Int	32	-2,147,483,648 to 2,147,483,648
Long	64	-9,223,372,036,854,775,808 to 9,223,372,036,854,775,807

B] Real no : float, double. [**Ex:** 5.23, 31.22] in decimal no's ko computer language me **Floating Point Numbers** khte ha.

<u>REAL NO</u>	<u>WIDTH IN BITS</u>	<u>APPROX.RANGE</u>
Float=single precision	32	1.4e-045 to 3.4e+038
Double=double precision	64	4.9e-324 to 1.8e+308

C] Character: [char] can represent any { **UNICODE CHARACTER** }=ye har language ke symbol, alphabet, sab k lia **INTEGER** value deta ha.

<u>CHARCTER</u>	<u>WIDTH IN BITS</u>	<u>APPROX.RANGE</u>
Char	16	Unicode character

D] Boolean: boolean KE sirf 2 values hoti ha **TRUE** or **FALSE**.

KEYWORDS

Ye ase words hote ha jo java ne apne liye reserve krke rkhe ha or unhe hum use ni krr skte.

Ex: class, public, static, void.

Inhe humm log apne kaam k lia use nahi kr skte
